## Let's differentiate some functions

## **TOTAL POINTS 5**

 In the following quiz, you'll apply the rules you learned in the previous videos to differentiate some functions. 1/1 point

We learned how to differentiate polynomials using the power rule:  $\frac{\mathrm{d}}{\mathrm{d}x}\left(ax^{b}\right)=abx^{b-1}$ . It might be helpful to remember this as 'multiply by the power, then reduce the power by one'.

Using the power rule, differentiate  $f(x) = x^{173}$ .

- $\int f'(x) = 174x^{172}$
- $\int f'(x) = 171x^{173}$
- $\int f'(x) = 172x^{173}$

4

/ Correct

The power rule makes differentiation of terms like this easy, even for large and scary looking values of b.

2. The videos also introduced the sum rule:  $\frac{\mathrm{d}}{\mathrm{d}x}\left[f(x)+g(x)\right]=\frac{\mathrm{d}f(x)}{\mathrm{d}x}+\frac{\mathrm{d}g(x)}{\mathrm{d}x}$ .

1/1 point

This tells us that when differentiating a sum we can just differentiate each term separately and then add them together again. Use the sum rule to differentiate  $f(x)=x^2+7+\frac{1}{x}$ 

- $\bigcirc f'(x) = 2x + \frac{1}{x}$
- $\bigcirc f'(x) = 2x + \frac{1}{x^2}$
- (a)  $f'(x) = 2x \frac{1}{x^2}$

/ Correct

The sum rule allows us to differentiate each term separately.

3. In the videos we saw that functions can be differentiated multiple times. Differentiate the function f(z)

CONTRACTOR

3. In the videos we saw that functions can be differentiated multiple times. Differentiate the function  $f(x) = e^x + 2\sin(x) + x^3$  twice to find its second derivative, f''(x).

1/1 point

$$\int f''(x) = xe^{x-1} - 2\cos(x) + 6x$$

$$f''(x) = e^x - 2\sin(x) + 6x$$

$$f''(x) = e^x + 2\cos(x) + 3x^2$$

$$f''(x) = e^x + \sin(x) + 3x^2$$

Correct

You used the sum rule, power rule and knowledge of some specific derivatives to calculate this. Well done!

4. Previous videos introduced the concept of an anti-derivative. For the function f'(x), it's possible to find the anti-derivative, f(x), by asking yourself what function you'd need to differentiate to get f'(x). For example, consider applying the "power rule" in reverse: You can go from the function  $abx^{b-1}$  to its anti-derivative  $ax^b$ .

1/1 point

Which of the following could be anti-derivatives of the function  $f'(x) = x^4 - \sin(x) - 3e^x$ ? (Hint: there's more than one correct answer...)

$$f(x) = \frac{1}{5}x^5 + \cos(x) - 3e^x + 4$$

✓ Correct

Differentiating f(x) gives the intended f'(x). We also see that when calculating anti-derivatives we can add any constant, since the derivative of a constant is zero. We might write this as  $f(x) = \frac{1}{5}x^5 + \cos(x) - 3e^x + c$ , where c can be any constant.

$$f(x) = \frac{1}{5}x^5 + \cos(x) - 3e^x - 12$$

✓ Correct

Differentiating f(x) gives the intended f'(x). We also see that when calculating anti-derivatives we can add any constant, since the derivative of a constant is zero. We might write this as  $f(x) = \frac{1}{5}x^5 + \cos(x) - 3e^x + c$ , where c can be any constant.

5. The power rule can be applied for any real value of b. Using the facts that  $\sqrt{x}=x^{\frac{1}{2}}$  and  $x^{-a}=\frac{1}{x^a}$ , calculate  $\frac{d}{dx}(\sqrt{x})$ .

$$\bigcirc \ \frac{d}{dx}(\sqrt{x}) = -\frac{1}{2\sqrt{x}}$$

$$\bigcirc \frac{d}{dx}(\sqrt{x}) = \frac{1}{2}\sqrt{x}$$

$$\bigcirc \frac{d}{dx}(\sqrt{x}) = \frac{2}{x^2}$$

## ✓ Correc

This can also be useful when the power is a negative number. If you'd like to you can check that the power rule agrees with the derivative of  $\frac{1}{x}$  that you've already seen.
